

IN THE CLAIMS

1. – 49. (Canceled)

50. (Previously presented) A surgical device for passing suture through soft tissue comprising:

a body having a lumen to accommodate an elongate member having an opening to receive at least one strand of suture;

a first jaw and a second jaw connected to said body and encompassing at least a portion of the elongate member, one of the jaws moveable relative to the other and having an opening for allowing the elongate member therethrough and to the soft tissue; and

a puncturing projection having a distal portion and carrying a suture, the puncturing projection movable between a first position wherein the distal portion of the puncturing projection is substantially contained within an area between the first jaw and the second jaw and a second position wherein the distal portion of the puncturing projection extends beyond the first jaw.

51. (Canceled)

52. (Canceled)

53. (Previously presented) A surgical device for passing suture through soft tissue comprising:

a first elongate member having an opening receiving a strand of suture; wherein said first elongate member includes a first resting configuration and is compressible into a second, stressed configuration, and returns towards said first resting configuration as a compressive external force is reduced;

a second elongate member having a lumen to accommodate said first elongate member in the second, stressed configuration; and

a grasping mechanism comprising a first jaw and a second jaw connected to said second elongate member at a distal end thereof, with one of said jaws moveable relative to the other, and wherein said grasping mechanism clamps soft tissue while said first elongate member is advanced through the soft tissue to pass the strand of suture through the soft tissue outside said grasping mechanism through an opening in one of said jaws of said grasping mechanism.

54. (Canceled)

55. (Canceled)

56. (Previously presented) The device of claim 53, wherein said opening in said jaw is partially open and extends through a middle region of said jaw such that said jaw is removable from around a side of a strand of suture that has been passed into the soft tissue.

57. (Previously presented) The device of claim 53, wherein said opening in said first elongate member comprises an eyelet.

58. (Canceled)

59. (Previously presented) A surgical device for passing suture through soft tissue, the device comprising:

an elongate member having an opening receiving a strand of suture;
an elongate tube having a lumen to accommodate said elongate member; and
a pair of jaws attached to said elongate tube to clamp soft tissue; wherein one of said jaws has an opening to allow said elongate member and attached suture therethrough to the soft tissue and outside the pair of jaws.

60. (Previously presented) The device of claim 59, wherein said opening in said jaw is partially open and extends through a middle region of said jaw such that said jaw is removable from around a side of a strand of suture that has been passed into the soft tissue.

61. (Previously presented) The device of claim 59, wherein said opening in said elongate member comprises an eyelet.

62. (Previously presented) A surgical device for passing suture through soft tissue, the device comprising:

an elongate tubular member having a lumen; a suture passing member having a strand of suture attached thereto within said lumen; and

a grasping mechanism comprising a first jaw and a second jaw connected to said elongate tubular member at a distal end thereof, with one of said jaws moveable relative to the other, and wherein said grasping mechanism clamps soft tissue while the suture passing member slides within the lumen and passes suture through the soft tissue outside of the grasping mechanism through an opening in one of said jaws of said grasping mechanism.

63. (Canceled)

64. (Canceled)

65. (Previously presented) The device of claim 62, wherein said opening in said jaw is partially open and extends through a middle region of said jaw such that said jaw is removable from around a side of a strand of suture that has been passed into the soft tissue.

66. (Previously presented) The device of claim 62, wherein said opening in said suture passing member comprises an eyelet.

67. (Previously presented) The device of claim 62, further comprising a handle to manipulate movement of the jaws.
